

ABSTRACT OF THE DISCLOSURE

A work transferring and transporting apparatus has a plurality of transportation tables. A plurality of work holders for holding works are formed on the
5 respective peripheral edge portions of the transportation tables. Each work is transferred between each pair of adjacent transportation tables and transported. A work transfer section is provided between the adjacent transportation tables. The adjacent transportation
10 tables continuously rotate in synchronism with each other. In the work transfer section, the work having so far been held in one of the work holders of the one transportation table is transferred to one of the work holders of the other transportation table.
